Gathered information should be used to generate different routes/ paths around the Glasgow University campus. This can later be used to generate statistical data and feed it back to the user /for instance, most popular paths, quiet and fresh air routes, etc./.

This task is a functional requirement and will be split into sub-tasks if necessary.

User requirement:

As a user, I need to be able to see different data routes around Glasgow University campus in order to draw conclusions about different areas.

Non-functional requirement:

I need to be able to see my route on the map and I should learn how to track my location and movement within an hour of application usage.
